limited value. CT is usually diagnostic. Suppressive therapy with thyroid hormone and gland ablation with radioactive iodine are rarely effective. Surgical resection (thyroid lobectomy) is the preferred treatment for symptomatic or large mediastinal goitres, and many surgeons recommend excision for asymptomatic pa-

tients also.<sup>2</sup> Most mediastinal goitres can be removed through a standard cervical approach, but very large ones may also require a partial sternotomy. Occult thyroid cancer is found in about 5% of resected specimens.<sup>1,2</sup> Our patient would have benefited from surgical resection at the time of initial presentation.
