SUMMARY

During the coronavirus disease 2019 (COVID-19) pandemic, delaying lifesaving cancer surgeries must be done with extreme caution and thoughtfulness. Modelling indicates that delays in high-risk cancer surgeries beyond 6 weeks could affect long-term outcomes for thousands of Canadians. Consequently, it is possible that postponing cancer surgery without consideration of its implications could cost more lives than can be saved by diverting all surgical resources to COVID-19. This article provides general guidance on supporting curative surgical treatment where appropriate and with available resources.

During the coronavirus disease 2019 (COVID-19) pandemic, the number of cases and deaths may become overwhelming, causing health care leadership and practitioners to face ethical and practical challenges. Several jurisdictions have already started reprioritizing surgical procedures in order to free up health care resources, including ventilators and intensive care unit (ICU) beds, to manage potential COVID-19 cases.

Delaying lifesaving cancer surgeries must be done with extreme caution and thoughtfulness, as delays can have a major impact on long-term survival, patient morbidity and the efficient use of surgical human resources. Postponed cancer surgery can also lead to conditions, such as bowel obstruction or spinal cord impingement, requiring emergent surgeries that otherwise could have been elective. Modelling indicates that delays in high-risk cancer surgeries beyond 6 weeks could affect long-term outcomes for thousands of Canadians. Consequently, it is possible that postponing cancer surgery, if done without consideration of its implications, could cost more lives than can be saved by diverting all surgical resources to COVID-19.

This article provides general guidance on supporting curative surgical treatment where appropriate and with available resources. It reflects the expertise and advice of the executive leadership of the Canadian Network of Surgical Associations for Cancer Care, the Canadian Association of Provincial Cancer Agencies, the Canadian Partnership Against Cancer and clinical cancer experts across the country. Recommendations from Canadian and international jurisdictions have been used to inform this guideline.

GUIDANCE ON COMPETING NEEDS AND PRIORITIZATION CRITERIA

Within Canada, many provinces have developed “cancer patient priority classification” systems to assist cancer programs in the management of cancer patients (Box 1). This must be contextualized within the current load on the system and anticipated trajectory, not only of a COVID-19 caseload, but also a backlogged cancer caseload, both of which are populations with critical lifesaving surgical needs.

Contemporaneous decisions will be needed that are data driven where possible and that consider today's and tomorrow's needs with at least a medium timeframe; we recommend a 6-month view of management in the Canadian health care system. The following are common guiding principles that we believe should form the basis of a pan-Canadian approach to this problem.

Cancer surgery should be designated "essential"

Most cancer surgeries are of high priority and curative. Cancer surgery should continue to be designated as "essential" and should be among the last types of surgery to be delayed.¹

Transfer care of cancer patients to less overwhelmed institutions as a first-line strategy

Once a hospital reaches a critical mass of patients receiving mechanical ventilation, nonemergency surgeries will not be able to be carried out. Under these circumstances, we recommend jurisdictional, then regional coordination among health authorities, institutions and surgeons to transfer care of cancer patients to less overwhelmed institutions as a first-line strategy, rather than delaying cancer surgery.²

High-level guidance around prioritization is needed if delaying cancer surgery becomes necessary

If delaying cancer surgery becomes necessary, we recommend high-level pan-Canadian and jurisdictional guidance around prioritization, with explicit prioritization tiers, to bring transparency and consistency to the approach, recognizing that ultimate decision making will be need to be done locally.¹ Examples of resources for establishing evidence- and risk-based prioritization are shown in Box 1. Whichever tool is used, it will need to recognize that some cancer patients require more urgent care, while others can safely wait a longer period of time.

- Ideally, the prioritization tool used by a jurisdiction should be linked to the changing level of an institution's surgical resources to guide decision making regarding cancer surgery cases to be performed/delayed.
- Any triage of patients must be done equitably. Clinical triage for major surgery should be guided by ethical principles. Relevant ethical principles are utility, proportionality and fairness.³

There must be concrete plans in place to carry out delayed surgeries within a reasonable period of time

Multidisciplinary care should be leveraged on a case-by-case basis to enable safer delays for some cancer surgery

ies (e.g., when temporizing treatments, such as neoadjuvant chemotherapy and/or radiation, are available). However, it is likely that this pandemic will stretch over many months until herd immunity, an effective treatment and/or a vaccine stems the tide of new cases. There must be concrete plans in place to carry out delayed surgeries within a reasonable period of time, even if the pandemic is not over.

Recovery planning for resumption of surgical services after the pandemic should start now

Eventually this pandemic will pass, and we will be faced with catching up on a backlog of surgical cancer cases. This means that the health system will need to operate at a surge well past the end of the COVID-19 crisis. Health system planners must account for this surge, as well as what care can continue to be provided during the

next period of time, in their future projections. Recovery planning for resumption of surgical services after the pandemic should start now and be communicated on a go-forward basis as the health system stabilizes; this planning should include an impact analysis of the projected long-term health care costs and human resource needs caused by delayed cancer treatment.

Competing interests: J. Bentley is a member of the advisory boards of AstraZeneca and NSV Tech, and his institution receives funding from Merck, AstraZeneca and Clovis for trials he is involved in. T. Zhong is supported by a Canadian Institutes of Health Research (CIHR) New Investigator Award (2015–2020) and she is the inaugural Belinda Stronach Chair in Breast Cancer Reconstruction Surgery at the University Health Network (2017–2022). C. Ball is co-editor in chief of *CJS*; he was not the accepting editor on this manuscript. No other competing interests were declared.

Contributors: All authors contributed substantially to this guidance article. C. Finley, A. Prashad, C. Daly, L. Helyer, D. O'Connell, H. Moloo, J. Werier, T. Zhong and C. Earle conceived the idea for the article. A. Prashad, N. Camuso and C. Ball compiled the current best evidence, which all authors assessed. C. Finley, A. Prashad, N. Camuso, C. Daly, C. Ball, A. Seely, T. Zhong and C. Earle wrote the article, which all authors reviewed and approved for publication.

Acknowledgements: Both the Canadian Partnership Against Cancer and the Canadian Network of Surgical Associations for Cancer Care would like to acknowledge the valuable contributions of the Canadian Association of Provincial Cancer Agencies for their input and guidance in the production of the document.
